1. Proposed Architecture & System Scope

The Travel Agency System is a conceptual full-stack platform designed to manage holiday tour packages, customized itineraries, transport booking coordination, and customer reservation histories.

The platform addresses the need for centralized booking workflows across destinations, lodging, and guided excursions.

2. System Modules & Planned Architecture

• **Destination & Package Showcase:** Filterable travel packages with day-wise itineraries, inclusion lists, and pricing.

• **Booking & Reservation Engine:** Passenger details entry, travel date selection, and reservation state tracking.

• **Agency Management Console:** Package creation, capacity allotments, and customer enquiry tracking.

• **Planned Tech Stack:** React frontend, Python Django REST Framework backend, PostgreSQL database.

3. Documentation & Verification Notice

• **Status:** Needs repository verification. Editable placeholder maintained in project data catalog.

Architecture Note: Repository URL is pending publication. Architectural blueprints, entity relationships, and API specifications are maintained here for technical portfolio evaluation.
